Hypervolume histories — fixed scaling within each climate scenario
Present — sampled every 100 trials
Hypervolume (higher is better)
Final HV = 1.166884
Cumulative attempted trials (including infeasible trials)
2℃ — sampled every 100 trials
Hypervolume (higher is better)
Final HV = 1.187653
Cumulative attempted trials (including infeasible trials)
4℃ — sampled every 100 trials
Hypervolume (higher is better)
Final HV = 1.388127
Cumulative attempted trials (including infeasible trials)
Scenario scales differ: compare search progress, not climate outcomes or robustness.
